# Multi-Attribute Auctions: Application to Workflow Management Systems

Albert Pla Planas

Supervisors: Dra. Beatriz López and Dr. Javier Murillo Departament EEEA

Universitat de Girona

### Index

- Introduction
- Auctions for multi-attribute resource allocation
- PUMAA: Preserving utility multi-attribute auctions
- FMAAC: Framework for multi-attribute auction customization
- Multi-dimensional fairness for multi-attribute auctions
- Conclusions

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions

### Introduction

### Auctions in workflow management systems

- Auctions allow an optimal allocation for just-in-time:
  - Competitive market
  - Optimization according to a given criteria.

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensiona	ll Fairness	Conclusions
Auctions & Workflows	Dimensionality	Allocation issues	Multi-attribu	te auction	Challenges	Contributions

### Auctions in workflow management systems

- Just-in-time resource allocation
- Special domains:
  - Production not known in advance
  - Production under demand / Supply chain under demand
  - Handling unexpected tasks (provoked by faults)
  - Unknown resource status
  - Outsourced resources

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensiona	ll Fairness	Conclusions
Auctions & Workflows	Dimensionality	Allocation issues	Multi-attribu	te auction	Challenges	Contributions

### WMS: Multi-dimensional allocation problem

- Workflow managers are not only concerned by costs:
- Workflow managers are concerned about multiple attributes:
  - Economic costs
  - Product quality
  - Delivery times
  - Licenses / ISO standardizations
  - $CO_2$  emissions
  - Energy consumption

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensiona	al Fairness	Conclusions
Auctions & Workflows	Dimensionality	Allocation issues	Multi-attribu	te auction	Challenges	Contributions

### WMS: Multi-dimensional allocation problem

- Multi-criteria allocation problem
  - Number of attributes considered in the allocation > 1
  - Modifying one attribute can condition the value of the rest
- Multi-attribute auctions
  - Number of attributes involved in the auction >1
  - Bids composed by several attributes.
  - Usually economic cost plus another attribute.
- Develop a multi-attribute auction mechanism for allocating resources and tasks in workflows

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensiona	l Fairness	Conclusions
Auctions & Workflows	Dimensionality	Allocation issues	Multi-attribu	te auction	Challenges	Contributions

### Resource allocation in the supply chain issues

- Example: Smartphone manufacturer.
  - Needs to provide a bundle of smartphones in two days.
     Deadline = 2800 minutes
  - Sequentially outsources the manufacturing of the phone parts and ensembles them.
  - Maximum Budget = 200€

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensiona	al Fairness	Conclusions
Auctions & Workflows	Dimensionality	Allocation issues	Multi-attribu	te auction	Challenges	Contributions

#### **Recurrent** auctions issues

- Always the same participants in the market.
- **Bidder drop problem (BDP)**: Unsatisfied bidders leave the auction and the stronger bidders create an oligopoly.

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensiona	al Fairness	Conclusions
Auctions & Workflows	Dimensionality	Allocation issues	Multi-attribu	te auction	Challenges	Contributions

### Challenges

- Multi-attribute incentive compatibility
  - Encourage resource providers (RP) to reveal their true values in terms of cost and attributes (respect their agreements)
- Workflow related issues
  - Misdelivered tasks
  - Delays, budget problems, quality problems...
- Recurrent auctions' issues
  - Bidder drop problem
  - Fairness in multi-criteria problems

## Auctions for Multi-Attribute Resource Allocation (MARA)

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensional Fairnes	ss Conclusions
Auction steps	Auction properties	State of the	art	Dimensionality	MAA for task allocation

### Background: Auction protocol steps

- 1. Call for proposals (CFP)
- 2. Bidding
- 3. Winner determination problem (WDP)

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensional F	airness Conclusions
Auction steps	Auction properties	State o	f the art	Dimensionality	MAA for task allocation

### Background: Auction Properties

- Mechanism Properties
  - Incentive Compatibility
     Encourage truthful bidding
  - Efficiency
    - •Best allocation possible
  - Buyer optimality
    - •Best possible price
  - Individual-rationality
    - •It is not harmful to participate
  - Budget-balance
    - •No need of external subsidy

- Allocation properties
  - Social Welfare
    - Utilitarian
    - Egalitarian
  - Robustness
    - Reduce utility loss
    - Provide alternative solutions
  - Reliable
    - Confidence of success

Introduction	Auctions for MARA	PUMAA	FMAAC	Multi-dimensional Fairnes	ss Conclusions
Auction steps	Auction properties	State of the	art	Dimensionality	MAA for task allocation

### PUMAA:

#### Preserving Utility Multi-attribute Auctions

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions	
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties	

#### Requirements

- Reverse auction mechanism for task & resource allocation
- Several attributes
- Incentive Compatible
  - Economic cost (bidders bid their real economic aims)
  - Attributes (bidders submit the attributes they intend to deliver)
- Tolerance to uncertainty of task delivery
  - The delivered attributes may vary from the ones agreed
- Robustness (avoid utility loss)

[2] Multi-Attribute Auction Mechanism for Supporting Resource Allocation in Business Process Enactment. A Pla, B López, J Murillo STAIRS@ECAI 2012, 228-239

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### Assumptions & limitations

- Unknown task schedule (allocated on-the-go)
  - Discards COP solvers, genetic algorithms, etc.
- Tasks are always developed (in better or worst conditions)
- The variation of the task attributes affects agents utilities
- Bidding strategies are out of the thesis scope
- No externalities: Bidders are just concerned in the present auction

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### 1. PUMAA: Call for Proposals

• An auctioneer  $a_0$  needs to allocate a task  $T^j$ 

$$T^{j} = \left\langle pa_{1}^{j}, \cdots, pa_{m}^{j} \right\rangle$$

- Sends a call for proposals (CFP) to all the bidders
  - Specifies the task
  - Specifies the attribute requirements

$$CFP = \left(T_0^j, \left\langle ar_0^1, \cdots, ar_0^n \right\rangle\right)$$

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### 2. PUMAA: Bidding

- Bidders  $(a_i)$  evaluates the CFP and submits a bid  $B_i = (b_i, AT_i)$
- Utility of a bidder:

$$b_i^t = v_i(T_0^J, AT_i^t)$$
$$u_i(p_i, b_i^t) = p_i - b_i^t$$

• Truthful or untruthful bid

$$B_i = (b_i, AT_i) | b_i = b_i^t \lor AT_i = AT_i^t$$
  
$$B_i = (b_i, AT_i) | b_i \neq b_i^t \lor AT_i \neq AT_i^t$$

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### 3. PUMAA: Winning determination problem

• The winner is determined by an evaluation function V<sub>o</sub>

 $V_0(b_i, AT_i)$ argmin<sub>i</sub>(V\_0(b\_i, AT\_i))

• The evaluation function will maximize the auctioneer  $a_0$ 's expected utility  $\bar{u}$ .

$$\bar{u}_0(T_0^j, b_i, AT_i) = v_0(T_0^j) - f_0(b_i, AT_i)$$

 $\rightarrow$  valuation of the attributes (e.g. V<sub>0</sub>)

 $\rightarrow$  Value of the task

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

#### 4. PUMAA: Payment rule

• Conditional Vickrey-based payment:

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### Evaluation (V<sub>0</sub>) function requirements

- Real Valued Function
  - V<sub>0</sub>(b,AT) must return a real number evaluation for each bid
    - The payment mechanism involves the numeric evaluation obtained by the second best bid.
  - Discards multi-criteria methods which result in ranked lists or orders without numeric valuations.
    - If there is not a numeric evaluation, the payment cannot be computed

[3] *Multi Criteria Operators for Multi-attribute Auctions* A Pla, B López, J Murillo Modeling Decisions for Artificial Intelligence (MDAI) 2012, 318-328.

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### Evaluation function requirements

- Monotonicity
  - If an attribute is improved, the score of the evaluation must also improve.
  - Ensures that, for every possible value in the attribute domain, V<sub>0</sub> (b,AT) will return a value.
  - Only applied in the range of values an attribute can take.
    - Example: If an attribute can only take positive values (time duration), it can be evaluated using its square function.

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### **Evaluation function requirements**

- Bijection
  - In order to calculate the payment,  $V_0$  (*b*,*AT*) must have a bijective behavior regarding the economic attribute.
  - Given:

$$V_0(b,AT) = x$$

its reverse function will be

$$V_0^{-1}(x,AT)=b$$

where *b* can be just one value

- Need of distinguish between economic attribute b and AT
- Avoid vertical asymptotes to avoid payments of infinite value

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### Evaluation function examples

• Product

$$V_{0}(b_{i}, AT_{i}) = b_{i} * \prod_{j=1}^{n} at_{i}^{j}$$

$$p_{1} = \begin{cases} \frac{b_{2} * \prod_{j=1}^{j=n} at_{2}^{j}}{\prod_{j=1}^{n} at_{1}^{j}} & \text{if } AT_{1}^{\prime} \succeq AT_{1} \\ \frac{b_{1} * \prod_{j=1}^{j=n} at_{1}^{j^{\prime}}}{\prod_{j=1}^{n} at_{1}^{j}} & \text{if } AT_{1}^{\prime} \prec AT_{1} \end{cases}$$

Weighted sum

$$V_{0}(b_{i}, AT_{i}) = \mu_{0}b_{i} + \sum_{j=1}^{n} \mu_{j}at_{i}^{j}$$

$$p_{1} = \begin{cases} \frac{\mu_{0}b_{2} + \sum_{j=1}^{n} \mu_{j}(at_{2}^{j} - at_{1}^{j})}{\mu_{0}} & \text{if } AT_{1} \succeq AT_{1}^{\nu} \\ \frac{\mu_{0}b_{1} + \sum_{j=1}^{n} \mu_{j}(at_{1}^{j'} - at_{1}^{j})}{\mu_{0}} & \text{if } AT_{1} \prec AT_{1}^{\nu} \end{cases}$$

- Mathematical norms
  - E.g. Euclidean norm

$$V_0(b_i, AT_i) = \sqrt{b_i^2 + \sum_{j=1}^n (at_i^j)^2}$$

$$p_1 = \begin{cases} \sqrt{b_2^2 + \sum_{j=1}^n ((at_2^j)^2 - (at_1^j)^2)} & \text{if } AT_1' \succeq AT_1 \\ \sqrt{b_1^2 + \sum_{j=1}^n ((at_1^{j'})^2 - (at_1^j)^2)} & \text{if } AT_1' \prec AT_1 \end{cases}$$

• Weighted sum of functions

$$V_{0}(b_{i}, AT_{i}) = \mu_{0}g_{0}(b_{i}) + \sum_{j=1}^{n} \mu_{j}g_{j}(at_{i}^{j})$$

$$p_{1} = \begin{cases} \frac{g_{0}'(\mu_{0}g_{0}(b_{2}) + \sum_{j=1}^{n} (\mu_{j}g_{j}(at_{2}^{j}) - \mu_{j}g_{j}(at_{i}^{j})))}{\mu_{0}} & \text{if } AT_{1}' \succeq AT_{1} \\ \frac{g_{0}'(\mu_{0}g_{0}(b_{1}) + \sum_{j=1}^{n} (\mu_{j}g_{j}(at_{1}^{j}) - \mu_{j}g_{j}(at_{1}^{j})))}{\mu_{0}} & \text{if } AT_{1}' \prec AT_{1} \end{cases}$$

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

#### **PUMAA: Incentive compatibility**

Introduction	Auctions for M	ARA	PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

### PUMAA: Incentive compatibility

- Finding a counter example with a constraint solver
  - Incentive compatible: For any feasible bid, the bidder's utility is higher by submitting the truthful attribute information:

 $\forall i \in \mathbb{N}, \forall (b_i, b_i^t, AT_i, AT_i^t) \in \mathbb{R} > 0 : \left\{ (u_i(b_i, AT_i, p) \le u_i(b_i^t, AT^t, p')) | (b_i^t \ne b_i') \lor (AT_i \ne AT_i^t) \right\}$ 

- ¿Is there any case not fulfilling this condition?
- Modeling the mechanism using an inequation system.
- Modeling the case where lying is better.
- If the inequation system is solvable  $\rightarrow$  **NOT INCENTIVE COMPATIBLE**
- If the inequation system has no solution  $\rightarrow$  **INCENTIVE COMPATIBLE**

[4] How to Demonstrate Incentive Compatibility in Multi-Attribute Auctions A Pla, B López, J Murillo Congrés Català d'Intel·ligència artificial (CCIA) 2013 FAIA 256, 303-306

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

#### PUMAA: Incentive compatibility

• Inequation system for the weighted sum

(a) 
$$a(AT_1) \neq a(AT'_1) \lor b_1 \neq b'_1$$
  
(b)  $\mu_1 b_1 + \mu_2 a(AT_1) < \mu_1 b_2 + \mu_2 a(AT_2)$   
(c)  $win = \begin{cases} 1 & \text{if } (\mu_1 b_2 + \mu_2 a(AT_2)) > \mu_1 b_1^t + \mu_2 a(AT'_1)) \\ 0 & \text{otherwise} \end{cases}$   
(d)  $win(\frac{\mu_1 b_2 + \mu_2 a(AT_2) - \mu_2 a(AT'_1)}{\mu_1} - b_1^t) < (\frac{\mu_1 b_1 + \mu_2 a(AT_1) - \mu_2 a(AT'_1)}{\mu_1} - b_1^t)$   
(e)  $\mu_1 + \mu_2 = 1$   
(f)  $0 < \mu_1 < 1$   
(g)  $0 < \mu_2 < 1$ 

Using Z3 constraint solver (real arithmetic logic):
 Not solvable → Incentive Compatible

Introduction	Auctions for MARA		PUMAA	FMAAC	Multi-dimensional Fairness	Conclusions
Requirements	Assumptions	PUMAA	Steps	Evaluation function	Incentive compatibility	Other properties

Introduction	Auctions fo	or MARA	PUMAA	FMAAC	Multi-dimensional Fai	irness	Conclusions
Multi-dimensional fairn	ess	Priority	Quantitative	Qualitative	Probabilistic	fair-PUMAA	Results

### Multi-dimensional fairness

- Existing fairness methods are **uni-dimensional**.
- **Multi-dimensiona**l fairness: take into account all bidder-provided attributes.
  - Keep track of the auction victories and results
- Use a priority auctioneer-provided attribute  $w_i$  according to the bidders' auction history:
  - A high  $w_i$  means the agent might leave the market soon.
  - $-w_i$  should consider all the attributes
  - $-w_i \in [0,1]$

[8] Multidimensional Fairness for Auction-based Resource Allocation. A. Pla, B. López, J. Murillo Knowledge-based Systems. (Submitted on November, 2013).

Introduction	Auctions fo	r MARA	PUMAA	FMAAC	Multi-dimensional Fai	rness	Conclusions
Multi-dimensional fairn	less	Priority	Quantitative	Qualitative	Probabilistic	fair-PUMAA	Results

#### Quantitative methods

- Based on the number of victories or defeats.
- Won auction coefficient (WOC)
  - Relation between auctions won and auctions participated.
  - Proportional measure.

• Loosing streak (LS)

- Number of consecutives defeats
- Include cognitive distortions such as "bad luck sense"
- Defines a maximum loosing streak in which the player will not increase its priority.

$$w_i = 1 - \frac{1 + won(a_i)}{1 + par(a_i)}$$

$$w_i = 1 - \frac{max(0, ml - ls(a_i))}{ml}$$

Introduction	Auctions for	MARA	PUMAA	FMAAC	Multi-dimensional Fai	rness	Conclusions
Multi-dimensional fairn	ess	Priority	Quantitative	Qualitative	Probabilistic	fair-PUMAA	Results

### Qualitative methods

- Evaluating the quality of a bid respect to the winner bid:
  - Avoids dummy bids to increase quality
  - Favors high-quality bidders
  - Fitness function to evaluate the bids:

$$q_i = \frac{V_0(B_i')}{V_0(B_1')}$$

- Bid-based WOC
  - Relation between the auctions won and the bid quality.

$$w_{i} = 1 - \frac{1 + won(a_{i})}{1 + \sum_{j=0}^{c-1} q_{i}^{j}}$$

Quality of the bids during the loosing streak.

$$w_i = 1 - \frac{max(0, ml - \sum_{j=c-ls(a_i)}^{c-1} q_i^j)}{ml}$$

Introduction	Auctions for	or MARA	PUMAA	FMAAC	Multi-dimensional Fa	irness	Conclusions
Multi-dimensional fairn	ess	Priority	Quantitative	Qualitative	Probabilistic	fair-PUMAA	Results

### Probabilistic methods

• Priorities can affect the wealth rank of resource providers

**Resource Providers Revenue / Wealth Rank Order** 

Introduction	Auctions fo	or MARA	PUMAA	FMAAC	Multi-dimensional Fa	irness	Conclusions
Multi-dimensional fairn	ess	Priority	Quantitative	Qualitative	Probabilistic	fair-PUMAA	Results

### Probabilistic methods

- Probabilistic version of the previous methods
  - $w_i$  is only update at certain auctions according to an update probability  $up_0$
  - $up_0$  will condition the influence of the priority
  - Reduce the chances of a bidder learning its own priority

Minimize the bidder drop problem

15

#### **Conclusions: PUMAA**

• Design auction mechanism for allocating multi-attribute resources in uncertain and dynamic workflow environments.

•	PUMAA:	Published in:
	<ul> <li>Suitable for uncertain domains</li> </ul>	PRIMA 2011 / AILOG 2010
	<ul> <li>Attributes considered along the whole mechanism</li> </ul>	STAIRS@FCAI 2012
	<ul> <li>Utility preservation</li> </ul>	0 // (III (0 (0 E 0/ (1 E 0 I E

•	Evaluation function requirements — Monotonic, real-valued and bijective function	MDAI 2012
•	Tested with a real data-based MAS simulator	Journal of Intelligent Manufacturing ( <i>in press</i> )

#### **Conclusions: FMAAC**

- Classification of the attributes which can appear on multi-attribute auctions
  - Unverifiable bidder-provided
  - Verifiable bidder-provided
  - Auctioneer-provided
- Framework for multi-attribute auction customization
  - Generalization of PUMAA
  - Adaptation of the allocation to domain requirements
  - For instance: egalitarian allocations, trust-inclusion, etc.

Published in:

Expert Systems with Applications Journal 41(10), August 2014

### **Conclusions: Multi-dimensional fairness**

- Fairness in multi-attribute auctions must consider all the involved attributes.
- Definition of a fairness mechanism for multi-attribute auctions based on priorities.
  - Quantitative, Qualitative
  - Auctions won, Auctions lost
  - Deterministic, Probabilistic

 Experimentation showed that the use of priorities can minimize the bidder drop problem

Submitted to:

Knowledge-based Systems Journal (November 2013)

### Future works

- Generalize PUMAA for combinatorial auctions\*.
- Allow PUMAA to distinguish between "lies" and "estimation errors".
- Use similarity measures to allow "Unstructured bids".
- Add a trust-model to PUMAA using FMAAC\*.
- Adapt PUMAA to other domains such as the electricity smart grid or health-care management.
- Study how false-name bidding can affect the fairness mechanism.
